Conclusions

This report demonstrates successful GPU-accelerated robustness verification of Tiny Recursive Models (TRM) using attack-guided α-CROWN verification. **Key Takeaways:** Adversarial training at ε=0.15 provides strong certified robustness up to ε=0.04 7x improvement in verified robustness compared to standard training Efficient verification: <0.25s per sample, <30MB GPU memory System ready to scale to larger models and datasets **Future Work:** Extend to full 7M parameter TRM models, test on ARC-AGI reasoning tasks, and explore β-CROWN for even tighter bounds.
